Office Action Response - July 29, 2008

Amendment to the Claims

This listing of Claims will replace all prior versions and listings of Claims in the application.

- 1 1. (Currently Amended) A control system, comprising:
- 2 a storage device to store data signals and a mode designator, the mode
- 3 designator to select a first or a second mode of operation, wherein the storage
- 4 device includes a memory having multiple addressable storage locations, each
- 5 for storing a different respective set of data signals and a respective mode
- 6 designator to control how the data signals are to be utilized after the data signals
- 7 stored at the addressable storage location are read from the memory;
- 8 a circuit coupled to the storage device to receive as control signals
- 9 predetermined ones of the data signals along with the respective mode
- 10 designators to control whether the circuit operates in a first mode or a second
- 11 mode, the control signals to control operation of the circuit when the circuit is
- 12 operating in the first mode; and
- 13 Error Correction Code (ECC) logic coupled to the storage device to
- 14 interpret the predetermined ones of the data signals as ECC check bits to detect
- 15 errors in the data signals when the circuit is operating in the second mode.

2. (Cancelled)

3. (Cancelled)

Serial No. 10/675,841
Docket No. RA-5635

Examiner Ryan A. Dare, Group Art Unit 2186
Office Action Response – July 29, 2008

1 4. (Currently Amended) The system of Claim[[3]]_1, wherein the circuit
2 includes branch logic to utilize the predetermined ones of the data signals stored
3 at an addressable storage location to generate a next address for addressing the
4 memory if the mode designator stored at the addressable storage location
5 indicates the circuit will operate in the first mode.

5. (Cancelled)

1 6. (Original) The system of Claim 1, wherein the circuit includes logic to provide
2 one or more functions of an instruction processor.

1 7. (Original) The system of Claim 1, and further including a programmable
2 storage device coupled to the circuit to select the predetermined ones of the data
3 signals.

1 8. (Original) The system of Claim 1, and further including at least one parity
2 circuit coupled to the storage device to determine whether a parity error occurred
3 on any of a predetermined set of the data signals.

1 9. (Original) The system of Claim 8, wherein the at least one parity circuit
2 includes a circuit to determine whether a parity error occurred on the
3 predetermined set of the data signals when the circuit is operating in the second
4 mode.

Serial No. 10/675,841
Docket No. RA-5635

Examiner Ryan A. Dare, Group Art Unit 2186
Office Action Response - July 29, 2008

1 10. (Original) The system of Claim 1, wherein the ECC logic is coupled to ECC
2 complement logic to correct errors in the data signals that are detected by the
3 ECC logic when operating in the second mode.

1 11. (Original) The system of Claim 10, and further including logic coupled to the
2 ECC complement logic to provide the data signals to the circuit for use as control
3 signals after any errors detected by the ECC logic have been corrected.

1 12. (Currently Amended) A method of controlling a digital system, wherein the
2 digital system includes a memory having multiple addressable storage locations,
3 each storing a different respective set of data signals and wherein each of the
4 addressable storage locations includes circuits to store a respective mode
5 designator to control whether the system operates in a first mode or a second
6 mode after the data signals stored at the addressable storage location are read
7 from the memory, the method comprising:

8 a.) reading first data signals along with a mode indicator from [[a]] one of
9 the multiple addressable storage locations in the storage device;

10 b.) interpreting the first data signals as control signals to control one or
11 more functions of the digital system if operating in a first mode of operation as
12 determined by a state of the mode indicator; and

13 c.) interpreting the first data signals as Error Correction Code (ECC)
14 signals if operating in a second mode of operation as determined by the state of
15 the mode indicator.

Serial No. 10/675,841
Docket No. RA-5635

Examiner Ryan A. Dare, Group Art Unit 2186
Office Action Response – July 29, 2008

1 13. (Original) The method of Claim 12, and further including:
2 reading second data signals from the storage device; and
3 using the ECC signals to detect errors in the second data signals if
4 operating in the second mode of operation.

1 14. (Original) The method of Claim 13, wherein the storage device is a memory,
2 and wherein the first and second data signals are stored at a same addressable
3 location within the memory.

1 15. (Original) The method of Claim 14, wherein multiple memory addresses each
2 stores different respective first and second data signals.

1 16. (Original) The method of Claim 15, and further including using the first data
2 signals to generate a next address for addressing the memory when operating in
3 the first mode of operation.

1 17. (Previously Presented) The method of Claim 15, and further including:
2 reading one of the multiple memory addresses; and
3 interpreting at least one of the second data signals as the mode indicator
4 to indicate whether operation is occurring in the first or the second mode of
5 operation.

Serial No. 10/675,841
Docket No. RA-5635

Examiner Ryan A. Dare, Group Art Unit 2186
Office Action Response – July 29, 2008

1 18. (Previously Presented) The method of Claim 17, and including repeating the
2 steps of Claim 17 for each of multiple memory addresses.

1 19. (Original) The method of Claim 13, and further including, correcting an error if
2 the error is detected in predetermined ones of the second data signals.

1 20. (Original) The method of Claim 19, and further including programmably
2 selecting the predetermined ones of the second data signals.

1 21. (Original) The method of Claim 12, and further including programmably
2 selecting the first data signals.

1 22. (Original) The method of Claim 13, and further including interpreting one or
2 more of the second data signals as control signals to control an arithmetic logic
3 unit of an instruction processor.

1 23. (Original) The method of Claim 13, an further including using parity bits to
2 detect a parity error occurring within the first or the second data signals.

1 24. (Original) The method of Claim 23, and further including:
2 reporting any error detected using the ECC signals; and
3 reporting any error detected using the parity bits.

Serial No. 10/675,841
Docket No. RA-5635

Examiner Ryan A. Darc, Group Art Unit 2186
Office Action Response – July 29, 2008

1 25. (Original) The method of Claim 24, and further including:
2 servicing any error detected by the ECC signals at a time that is optimal
3 for the digital system; and
4 servicing any error detected using the parity bits substantially immediately.

1 26. (Currently Amended) A control system having a first and second mode of
2 operation, comprising:
3 storage means for storing data signals and[[a]] mode designators,
4 wherein the storage means includes multiple addressable means, each for
5 storing a different respective set of data signals and wherein each of the
6 addressable means includes mode means for storing a respective mode
7 designator, a state of the mode designator for selecting between operation in the
8 first mode or the second mode after the data signals stored at the addressable
9 means are read from the storage means;
10 control means for receiving the data signals with the mode designator, and
11 for utilizing first ones of the data signals to affect operations of the control system
12 when operating in the first mode; and
13 error means for interpreting the first ones of the data signals as check bits
14 for detecting errors occurring in second ones of the data signals when the
15 control system is operating in the second mode.

Serial No. 10/675,841
Docket No. RA-5635

Examiner Ryan A. Darc, Group Art Unit 2186
Office Action Response – July 29, 2008

1 27. (Previously Presented) The system of Claim 26, wherein the storage means
2 includes means for storing the mode designator to control whether the control
3 system is operating in the first or the second mode.

1 28. (Original) The system of Claim 26, wherein the control means includes
2 branch means for utilizing the first ones of the data signals to generate an
3 address for the storage means.

1 29. (Original) The system of Claim 26, wherein the storage means is a memory
2 including predetermined addressable locations, each storing a different
3 respective set of the first and second ones of the data signals.

1 30. (Original) The system of Claim 29, wherein each of the predetermined
2 addressable locations within the memory includes means for storing a mode
3 designator for controlling whether the control system operates in the first or the
4 second mode when the first and the second ones of the data signals stored at
5 the addressable location are read from the memory.

1 31. (Original) The system of Claim 30, wherein the error means includes means
2 for correcting an error detected on predetermined ones of the second ones of the
3 data signals when the control system is operating in the second mode.

Serial No. 10/675,841
Docket No. RA-5635

Examiner Ryan A. Dare, Group Art Unit 2186
Office Action Response – July 29, 2008

1 32. (Original) The system of Claim 31, and further including means for providing
2 corrected ones of the second ones of the data signals to the control means for
3 use in affecting the operations of the control system.

1 33. (Original) The system of Claim 31, and further including parity detection
2 means for detecting parity errors within the first or the second ones of the data
3 signals.

1 34. (Original) The system of Claim 33, wherein the parity detection means
2 includes means for detecting uncorrected parity errors remaining within the
3 second ones of the data signals.

1 35. (Original) The system of Claim 33, and further including maintenance means
2 for performing error recovery actions within a first time period for errors detected
3 by the parity detection means and, for errors detected by the error means,
4 performing error recovery actions any time the control system is appropriately
5 configured.

1 36. (Original) The system of Claim 26, and further including means for
2 programmably selecting the first ones of the data signals.

Serial No. 10/675,841
Docket No. RA-5635

Examiner Ryan A. Dare, Group Art Unit 2186
Office Action Response—July 29, 2008

37. (Original) The system of Claim 31, and further including means for programmably selecting the predetermined ones of the second ones of the data signals.
